

Changelog - 2026-02-12

Summary

This changelog records updates completed on February 12, 2026 for API stability, Admin dashboard data accuracy, and Doctor module consolidation.

Backend Changes

1) Users API JSON parse failure fix

- File: `backend/routes/users.php`
- Change: Updated `GROUP BY` to include `u.gender` in `/users` list query.
- Why: Prevent SQL errors on strict MySQL modes (for example `ONLY_FULL_GROUP_BY`) that can emit PHP/HTML error output and break frontend JSON parsing.

2) Admin staff performance now reflects live DB session presence

- File: `backend/routes/admin.php`
- Endpoint: `GET /admin/staff_perf`
- Ensured session schema/table availability (`AuthMiddleware::ensureSessionColumns` , `AuthMiddleware::ensureSessionTable`).
- Added live active-session presence aggregation from `users` + `user_sessions` .
- Combined presence result using `max(presentByShifts, presentBySessions)` .
- Added role-presence fallback from live sessions when shift-based role presence is empty.
- Why: Top Admin overview tiles should use real database session state, not only current shift window overlap.

Frontend Changes

3) Admin overview metric source cleanup

- File: `frontend/pages/admin/dashboard.html`
- Removed metric-tile overwrite logic from `loadUsers()` .
- Kept overview tiles sourced from `/admin/staff_perf` via `loadStaffPerformance()` .
- Why: Avoid race conditions where `loadUsers()` and `loadStaffPerformance()` disagree.

4) Doctor module unified to one entry page

- File: `frontend/pages/doctor/dashboard.html`

- Added hash-based tab deep-linking support and initial hash activation on page load.
- Updated tab switching to sync URL hash.
- Why: Consolidate multiple doctor pages into a single module shell.

5) Legacy doctor pages removed

- `frontend/pages/doctor/appointments.html`
- `frontend/pages/doctor/my_patients.html`
- `frontend/pages/doctor/reports.html`
- Why: Complete unification of Doctor UI under `dashboard.html` .

Validation Performed

- `php -l backend/routes/users.php` -> no syntax errors.
- `php -l backend/routes/admin.php` -> no syntax errors.

Notes

Existing unrelated workspace changes and historical log file updates were left intact.
